

Software Design and Engineering

Lab Document

High Level Purpose Statement:	I want to figure out how to use Django to create a simple backend for a fake store. Ultimately this is for learning Django features and how to use Django
Experimental Design:	I would like for the software to create a user and assign money. Then the user can look at different products and “purchase” one with the fake money.
Resources Available:	Python Backend Web Development Course (with Django) Using this youtube video to help learn how to use Django.
Time Estimate:	Including watching a majority of this 10 hour (first 3 hours are python tutorial so skipping that) video I think The project should take around 10-12hours. About 7ish for learning and 3-5 for implementation.
Experiment Notes:	Django is a bit obtuse. There is a lot of jumping around between files to work on stuff. Adding the logic to the views page, doing the url mapping in the url page and the redirecting in the HTML files just leads to a lot of clicking.
Results:	Pretty happy with how it turned out. I think I definitely have a handle on using Django to work on website backend. Need to pair it with a front end tool like React and ill be in buisness
Consequences for the Future:	I could definitely see myself using Django again but I’ve heard that python is not the best lang for backend programming so maybe a different tool would be better. Having said that Id hate for all this learning to go to waste so Ill probably stick with Django for a while.
